DATA COLLECTION

Road Accident Data – India, 2022

1. Dataset Overview

The working dataset contains 759 records and 9 fields related to road accidents in India for the year 2022. It is organized by State/UT and district/location and includes accident cases, injuries, deaths, data status, and source information. The dataset is intended for descriptive analysis of recorded road-accident information.

2. Data Source

The primary national reference is the Ministry of Road Transport and Highways (MoRTH), Government of India, publication 'Road Accidents in India – 2022'. The report uses information supplied by State and Union Territory Police Departments. State Police and Transport Department reports are also referenced where district-level figures are available.

3. Data Collected

Variable	Data Type	Description
Record ID	Numerical / Identifier	Unique identifier assigned to each row in the working dataset.
Year	Numerical	Reporting year; 2022.
State/UT	Categorical	State or Union Territory associated with the record.
District	Categorical	District or location represented in the record.
Accident Cases	Numerical	Number of road accident cases recorded in the dataset.
Injured	Numerical	Number of people injured, as represented in the source or working record.
Died	Numerical	Number of deaths, as represented in the source or working record.
Data Status	Categorical	Indicates whether the row is official, estimated, or based on verified district-level information.
Source	Text	Records the source or source type associated with the row.

4. Purpose of Data Collection

- Compare recorded road accident cases across states and districts.
- Study the recorded number of injured people and deaths by location.
- Prepare a structured dataset for cleaning, analytics, and visualization.
- Keep source and data-status information available to help interpret the figures.

5. Dataset Coverage

The current CSV contains 759 records across 35 State/UT labels in the working dataset. The coverage reflects the records present in this file; it should not be interpreted as a complete official district-level census for every State/UT.

6. Source and Data-Quality Note

The MoRTH national publication provides State/UT-level road-accident statistics, while district-level information is not uniformly available in that report. The working dataset therefore includes rows with different data-status labels,

including estimated values based on State/UT totals. Estimated district values must not be described as directly reported or verified district statistics. Some district fields may require further validation during the cleaning stage, and all findings should be interpreted according to the recorded Data Status and Source fields.

7. Output

CSV file: RoadSense_AI_Task_2_Road_Accident_Data_2022.csv

This CSV is the collected working dataset and will be used as the input for the next data-cleaning stage. The raw file should be retained separately so that the original collected data remains available for comparison.

8. Next Step

The next stage will inspect missing values, duplicate records, inconsistent labels, and data types using Python. Any changes made during cleaning should be documented, and the original source values should not be silently presented as verified when they are estimated or uncertain.
